

Outbound Progress Report

Taking Shape 3-29-17

The prototype is taking shape along with the Raven featuring the 180 HP Titan. The Raven will be the test bed for the wing and engine install as we complete the first Outbound. It will also prove the retro adaption of the metal wing to the Raven and possibly the Courier.

Test assembly of the final static wing specimen. This is to double check hole line-ups and exits.

Test fitting to the prototype fuselage. Looks very good!

Looking at the single strut from the pilot seat. This is going to be a very common sight in the near future.

The internal wing truss fits neatly up inside the wing, aligned with the load path of the lift strut.

Detail of the internal wing truss and strut connection, no official bolts were used in the test fitting.

Thanks for tuning in! More to follow....RJS
